

## ABSTRACT OF THE DISCLOSURE

A mobile communication system is provided that can increase the number of radio base stations undergoing the group control, and enable multichannel connection without modifying a hardware configuration and without concentrating a control load on a master base station. In the system, only the master base station includes a radio circuit control channel controller for controlling radio circuit side control channels. Individual radio base stations including the master base station, which constitute a group control base station complex, each include a wired circuit control channel controller for controlling a wired circuit side control channel.
